

Table B3. Summary of recommendations—adult ankle and foot disorders

Patient presentation	Recommendations
<p>Adult with acute ankle and foot injury but negative findings on the OAR</p> <p>Consider radiographs only of patients excluded from the OAR:</p> <ul style="list-style-type: none"> • Multiple injuries • Isolated skin injury • 10 d since injury • Obvious deformity of ankle or foot • Altered sensorium: cognitive or sensory impairment (neurologic deficit), head trauma, intoxicated 	<p>Radiographs not routinely indicated [B]</p>
<p>Adult with acute ankle and foot injury and positive findings on the OAR</p> <p>(a) Ankle (positive OAR)</p> <p>Radiographs required only if there is pain in the malleolar zone and any of these findings:</p> <ul style="list-style-type: none"> • Bone tenderness of distal fibula along posterior edge or tip of lateral malleolus (distal 6cm) • Bone tenderness of distal tibia along posterior edge or tip of medial malleolus (distal 6 cm) • Inability to bear weight both immediately and in clinic <p>Also consider taking ankle radiographs in:</p> <ul style="list-style-type: none"> • Older patients with malleolar tenderness and pronounced soft tissue edema. • Presence of positive OAR foot findings <p>(b) Foot (positive OAR)</p> <p>Radiograph required only if there is pain in the midfoot zone and any of these findings:</p> <ul style="list-style-type: none"> • Bone tenderness of base of fifth metatarsal • Bone tenderness of navicular bone • Unable to bear weight both immediately and in clinic 	<p>Ankle radiographs indicated [B] AP ankle, 20° medial oblique (mortise views) and lateral (include base of fifth metatarsal)</p> <p>Additional views [D]: Stress radiographs after fibular fracture helpful pre-operatively to determine deltoid ligament status in orthopedic setting.</p> <p>Special investigations [D]</p> <ul style="list-style-type: none"> • MRI or CT appropriate in presence of significant pain and disability and negative radiographs • Fluoroscopic stress examination under anesthesia to assess ankle instability • NM for persisting symptoms to exclude stress fracture <p>Foot radiographs indicated [B]</p> <p>When feasible, weight-bearing foot AP, lateral, medial oblique views</p> <p>Comparison views (normal foot) may be helpful.</p> <p>Additional view: tangential view of calcaneus for heel trauma cases</p>
<p>Adult with acute toe injury</p> <p>Consider obtaining foot radiographs in presence of significant metatarsal pain (see OAR-Foot)</p>	<p>Radiographs indicated [GPP]: AP, oblique, and lateral views limited to the toes</p>
<p>Adult with chronic ankle and tarsal pain</p> <p>Specific indications for radiographs include:</p> <ul style="list-style-type: none"> • Suspected osteochondral lesion/stress fracture • Suspected tendinopathy with possible inflammatory arthritis • Possible ankle instability. Single-leg jump test as clinical indicator of functional instability • Noninvestigated chronic ankle and tarsal pain • Multiple sites of degenerative joint disease as visualized on radiographs • Possible operative candidate 	<p>Radiographs indicated [D]</p> <p>AP ankle, lateral, medial oblique (mortise) views (Medial oblique view helps evaluate the talocalcaneal relationship and lateral malleolus.)</p> <p>Additional view: Stress radiographs may be considered, but little agreement exists as to which technique.</p> <p>Special investigations [D]</p> <p>MRI is the gold standard for musculoskeletal assessment if radiography is positive or if unrelieved by 4 wk of conservative care.</p> <ul style="list-style-type: none"> • Contrast-enhanced, fat-suppressed, 3D, fast-gradient MRI may be useful in diagnosing synovitis and soft tissue impingement.
<p>Specific clinical diagnoses</p> <p>1. Impingement syndromes</p> <p>Findings most strongly associated with abnormality at arthroscopy:</p> <ul style="list-style-type: none"> • Anterolateral tenderness • Swelling • Pain on single-leg squatting • Pain on ankle dorsiflexion and eversion 	<p>Radiographs indicated [D]</p> <p>AP ankle, lateral and mortise views</p> <p>Special investigations [D]</p> <p>For all suspected impingement syndromes with positive radiographs or unrelieved by 4 wk of conservative care:</p> <ul style="list-style-type: none"> • Contrast-enhanced, fat-suppressed, 3D, fast-gradient MRI may be indicated depending on pain severity and disability.

(continued on next page)

Table B3 (continued)

Patient presentation	Recommendations
<p>(a) Anterolateral impingement Clinical features:</p> <ul style="list-style-type: none"> • Mechanism: inversion injury • Pain and localized tenderness in region of anteroinferior tibiofibular and/or anterior talofibular ligament • Positive impingement sign 	<p>Radiographs indicated [D] AP, lateral, and mortise ankle views Additional view: [D] Stress radiographs may be considered.</p>
<p>(b) Anterior impingement Clinical features:</p> <ul style="list-style-type: none"> • Mechanism: supination or repeated dorsiflexion injury • Anterior pain • Painful and restricted dorsiflexion 	<p>Radiographs indicated [D] AP, lateral, and mortise ankle views</p>
<p>(c) Anteromedial impingement Clinical features:</p> <ul style="list-style-type: none"> • Mechanism: inversion injury or ankle/talar fracture • Anteromedial pain and tenderness • Swelling • Pain and restriction on dorsiflexion and supination 	<p>Radiographs indicated [D] AP, lateral, and mortise ankle views</p>
<p>(d) Posterior impingement Clinical features:</p> <ul style="list-style-type: none"> • Mechanism: impingement of os trigonum between talus and posterior tibia • Common in ballet dancers • Pain elicited with full weight-bearing in maximum plantar flexion, especially when os trigonum is present. • Tenderness behind lateral malleolus 	<p>Radiographs indicated [D] AP, lateral, and mortise ankle views</p> <p>Special investigations [D] MRI for os trigonum syndrome • Pain with passive plantar flexion</p>
<p>2. Peroneal tendinosis Clinical features:</p> <ul style="list-style-type: none"> • Lateral hindfoot pain • Cavovalgus foot deformity • Frequently affected in RA 	<p>Radiographs not routinely indicated [D] Unless unrelieved by 4 wk of conservative care or patient has a suspected inflammatory arthritis</p> <p>Special investigations [D] MRI or US if there are signs of popping or clicking with foot eversion</p>
<p>3. Lateral premalleolar bursitis Clinical features:</p> <ul style="list-style-type: none"> • Adventitious bursa develops after prolonged sitting with inverted and plantar flexed feet 	<p>Radiographs not routinely indicated [GPP]</p> <p>Special investigations [GPP] US if unrelieved by 4 wk of conservative care</p>
<p>4. Tarsal tunnel syndrome Clinical features:</p> <ul style="list-style-type: none"> • Tingling pain and burning over the sole of the foot after prolonged standing or walking • Worse at night in some • Positive Tinel sign • Positive nerve compression test • 2-Point discrimination • Hypoesthesia on sole of foot • Rare weakness of toe flexion 	<p>Radiographs not routinely indicated [D]</p> <p>Special investigations [D] • US or MRI for nerve and other soft tissue visualization • CT for bony abnormalities • Sensory conduction velocity and distal motor latency useful for diagnosis and treatment progression</p>
<p>Adult with chronic foot pain</p>	<p>Radiographs generally indicated [C] Non-weight-bearing AP, lateral, medial, and lateral oblique views Additional views: • Lateral views for toes • Axial and lateromedial tangential views for sesamoid bones Special investigations [D] • NM, MRI, US, arthrography may be useful • Laboratory investigations (blood and synovial fluid) recommended</p>
<p>A. Hindfoot-Heel pain</p>	<p>Radiographs indicated [D] AP, lateral, and medial oblique views of the foot Additional views: tangential view of the calcaneus and lateral calcaneus view</p>

Table (continued) B3 (continued)

Patient presentation	Recommendations
Specific clinical diagnoses	<p>Special investigations [D]</p> <ul style="list-style-type: none"> • MRI if unrelieved by 4 wk of conservative care or before referral for medical care or to podiatrist • Achilles enthesopathy: power Doppler sonography may show neovascularization, which may be the cause of pain.
<p>A1. Plantar fasciitis (PF) and calcaneal enthesosphyte (spur)</p> <p>Clinical features:</p> <ul style="list-style-type: none"> • PF is one of the most common soft tissue foot disorders • Hyperesthesia over the plantar fascia • Risk factors: <ul style="list-style-type: none"> ◦ Decreased ankle dorsiflexion ($\leq 0^\circ$) ◦ Being on their feet most of working day ◦ Obesity (body mass index $\geq 30 \text{ kg/m}^2$) 	<p>Radiographs not routinely indicated except in young athlete [B] AP, lateral, and oblique views</p> <p>Special investigations [D]</p> <ul style="list-style-type: none"> • US may be initial step for advanced imaging (readily available, highly sensitive, low-cost, and radiation-free). • Doppler/power US improves US value • US, MRI, and bone scan are more sensitive in showing inflammatory changes and thickening of the plantar aponeurosis in PF
<p>A2. Sinus tarsi syndrome</p> <p>Clinical features:</p> <ul style="list-style-type: none"> • Mechanism: inversion injury or inflammatory joint diseases • Lateral foot pain • Perceived foot instability • Tenderness of the sinus tarsi 	<p>Radiographs not initially indicated [D]</p> <p>Special investigations [D] MRI if unrelieved by 4 wk of conservative care: may be helpful for detecting subtle unilateral deformities</p>
<p>B. Midfoot pain (nontraumatic)</p> <p>Midfoot pain usually self-limiting.</p> <p>Differential diagnosis:</p> <ul style="list-style-type: none"> • RA • Psoriatic arthritis • Reactive arthritis (Reiter disease) • Diabetic neuroarthropathy/Charcot joints • Gout • Diabetic infection 	<p>Radiographs indicated if unrelieved by 4 wk of conservative care or in suspected inflammatory arthritis [D] AP, medial oblique, and lateral views of the foot</p> <p>Additional views: weight-bearing ankle series may be useful</p> <p>Special investigations if radiography is positive or if unrelieved by 4 wk of conservative care [GPP] CT or MRI warranted in suspected or proven disease, but negative/equivocal radiographs</p>
Specific clinical diagnoses	
<p>B1. Acquired flat foot with posterior tibial tendon dysfunction/rupture</p> <p>Clinical features:</p> <ul style="list-style-type: none"> • Medial ankle/foot pain initially • May lead to disabling weight bearing symptoms • Talonavicular subluxation • Difficulty or inability to perform single-limb heel rise • Weak resisted inversion of fully flexed foot 	<p>Radiographs indicated if unrelieved by 4 wk of conservative care or in suspected inflammatory arthritis [D] AP, medial oblique, and lateral foot radiographs</p> <p>Additional views: weight-bearing ankle series may be useful</p> <p>Special investigations [D]</p> <ul style="list-style-type: none"> • MRI better at differential diagnosis of medial ankle/foot pain • US may be useful
<p>B2. Navicular tuberosity pain and tenderness¹⁴⁸</p> <p>Potential painful normal variants such as accessory navicular bone (4%-21% of the population) have been described.</p> <p>Painful fibro-osseous junction of the accessory bone</p>	<p>Radiographs indicated if unrelieved by 4 wk of conservative care [C] AP, medial oblique, and lateral foot views</p> <p>Special investigations [GPP]</p> <ul style="list-style-type: none"> • MRI to differentiate accessory navicular from an avulsion fracture • NM may be useful to help identify or confirm site of pain.
<p>B3. Complex regional pain syndrome</p> <p>Synonyms:</p> <ul style="list-style-type: none"> • Reflex sympathetic dystrophy • Sudek's atrophy <p>Clinical features:</p> <ul style="list-style-type: none"> • Pain 	<p>Radiographs indicated [D] AP, lateral, and medial oblique views of the foot</p> <p>Special investigations [D]</p> <ul style="list-style-type: none"> • MRI is useful in detecting numerous soft tissue and earlier bone and joint processes that are not depicted or as well characterized with other imaging modalities • 3-Phase NM scan recommended if radiograph is not diagnostic

(continued on next page)

Table(continuedB3)(continued)

Patient presentation	Recommendations
<ul style="list-style-type: none"> • Tenderness • Swelling • Diminished motor function • Vasomotor and sudomotor instability <p>C. Forefoot pain</p> <p>See recommendations for the following specific clinical diagnoses:</p> <p>C1. Metatarsal bursitis C2. Morton neuroma C3. Stress fracture C4. Avascular necrosis (osteonecrosis) C5. Hallux rigidus and hallux valgus C6. Sesamoiditis</p>	<p>Radiographs not routinely indicated unless unresponsive to 4 wk of conservative care or if inflammatory or infectious etiology suspected [B] AP and lateral foot views</p> <p>Special investigations [D] MRI useful in differential diagnosis of forefoot pain such as stress fracture, metatarsophalangeal synovitis, and intermetatarsal bursitis</p>
C1. Metatarsal bursitis	<p>Radiographs not routinely indicated unless unresponsive to 4 wk of conservative care, or if inflammatory or infectious etiology suspected [GPP] AP and lateral foot views</p> <p>Special investigations [GPP] MRI useful in differential diagnosis of forefoot pain</p>
<p>C2. Morton neuroma</p> <p>Clinical features:</p> <ul style="list-style-type: none"> • Most commonly found in the 3-4 web space • Pain hyperesthesia or paresthesia radiation to the toes • Differential diagnosis from MTP arthritis may be difficult • Positive forefoot neuroma squeeze test 	<p>Radiographs indicated [C] AP, lateral, with or without oblique</p> <p>Special investigations [D] MRI</p>
<p>C3. Stress (fatigue or insufficiency) fracture</p> <p>Clinical features:</p> <p>Pain and tenderness present in the:</p> <ul style="list-style-type: none"> • Second and third metatarsal <ul style="list-style-type: none"> • calcaneus • First metatarsal • medial sesamoid • Navicular 	<p>Radiographs indicated [D] AP and lateral foot views with or without medial oblique specific to the area of complaint</p> <p>Special investigations [C] • High-field MRI with fat suppression or inversion recovery protocol. As sensitive as NM • CT still uncertain; some centers use US</p>
<p>C4. Osteonecrosis of metatarsal head (Freiberg infraction)</p> <p>Clinical features:</p> <ul style="list-style-type: none"> • Adolescent patient • Pain • Tenderness • Swelling • Limitation of movement at metatarsal head • Second or third head most commonly affected 	<p>Radiographs indicated [C] AP, lateral, with or without medial oblique of the foot</p> <p>Special investigations [C] MRI modality of choice to evaluate bone marrow changes in early stages</p>
<p>C5. Hallux rigidus and hallux valgus (first metatarsophalangeal joint)</p>	<p>Radiographs not routinely indicated unless unresponsive to 4 wk of conservative care [D] Lateral view most useful for dorsal osteophyte on the metatarsal head and possible osseous fragments Additional view: Weight-bearing series to quantify degree of valgus deformity</p>
<p>C6. Sesamoiditis</p> <p>Painful inflammatory condition caused by repetitive injury; reactive tendinitis, synovitis, or bursitis common</p>	<p>Radiographs not routinely indicated unless unresponsive to 4 wk of conservative care [D] Additional view: Lateromedial and tangential views for sesamoid bones</p> <p>Special investigations [GPP] MRI to differentiate from turf toe</p>
